

Early reports of RF noise in test areas for BPL have indicated very objectionable interference levels within amateur bands. It could be assumed that the frequencies of other licensed services would be affected similarly. Tests should be done by all affected services and the allowed interference be set to a level to not interfere with these services. If BPL cannot be used at levels low enough to not interfere with other services, it should not be allowed at all. thank you for your time. Clayton G Conard (amateur and commercial license holder).
